2

TORSION OF NON-CIRCULAR BARS:

Prandtl's Stress Function Method

Prandtl's Stress function ϕ is defined as

$$\tau_{zx} = \frac{\partial \Phi}{\partial y} \quad \tau_{zy} = -\frac{\partial \Phi}{\partial x} \quad \text{———— (1)}$$

When, $\sigma_{xx} = \sigma_{yy} = \sigma_{zz} = 0$; $\tau_{xy} = 0$; τ_{zx} and τ_{zy} are the only non vanishing components of stress the equations of elasticity are given below

Equilibrium Equation

$$\frac{\partial \tau_{zx}}{\partial z} = \frac{\partial \tau_{zy}}{\partial z} = 0 \quad (\text{Since the stresses are same in every cross section})$$

$$\frac{\partial \tau_{zx}}{\partial x} + \frac{\partial \tau_{zy}}{\partial y} = 0 \quad (\text{From the third equilibrium equation})$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

3

TORSION OF NON-CIRCULAR BARS:

Hooke's Law

The strain components $\epsilon_{xx} = \epsilon_{yy} = \epsilon_{zz} = \gamma_{xy} = 0$

$$\gamma_{zy} = \frac{1}{G} \cdot \tau_{zy}$$

$$\gamma_{zx} = \frac{1}{G} \cdot \tau_{zx}$$

Substituting for stress components τ_{zx} and τ_{zy} from equ.1

$$\gamma_{zy} = -\frac{1}{G} \cdot \frac{\partial \Phi}{\partial x} \quad \text{———— (2)}$$

$$\gamma_{zx} = \frac{1}{G} \cdot \frac{\partial \Phi}{\partial y}$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

4

TORSION OF NON-CIRCULAR BARS:

Compatibility Equation

The two relevant Compatibility equations for this problem are

$$\frac{\partial}{\partial x} \left(\frac{\partial \gamma_{zx}}{\partial y} + \frac{\partial \gamma_{xy}}{\partial z} - \frac{\partial \gamma_{yz}}{\partial x} \right) = 2 \frac{\partial^2 \epsilon_{xx}}{\partial y \partial z}$$

$$\frac{\partial}{\partial y} \left(\frac{\partial \gamma_{xy}}{\partial z} + \frac{\partial \gamma_{yz}}{\partial x} - \frac{\partial \gamma_{zx}}{\partial y} \right) = 2 \frac{\partial^2 \epsilon_{yy}}{\partial x \partial z}$$

$$\frac{\partial}{\partial x} \left(\frac{\partial \gamma_{zx}}{\partial y} - \frac{\partial \gamma_{yz}}{\partial x} \right) = 0$$

$$\frac{\partial}{\partial y} \left(\frac{\partial \gamma_{yz}}{\partial x} - \frac{\partial \gamma_{zx}}{\partial y} \right) = 0$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

5

TORSION OF NON-CIRCULAR BARS:

Substituting for γ_{yz} and γ_{xz} from equ. (2) the above two equations becomes

$$\frac{\partial}{\partial x} \left(\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} \right) = 0$$

$$\frac{\partial}{\partial y} \left(\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} \right) = 0$$

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = F \text{ (a constant)} \quad \text{--- (3)}$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

6

TORSION OF NON-CIRCULAR BARS:

Boundary Condition

$$n_x \tau_{xz} + n_y \tau_{yz} + n_z \sigma_{zz} = F_z$$

This gives

$$n_x \frac{\partial \Phi}{\partial y} - n_y \frac{\partial \Phi}{\partial x} = 0$$

$$\frac{\partial \Phi}{\partial y} dy + \frac{\partial \Phi}{\partial x} dx = 0$$

$$\frac{d\Phi}{ds} = 0$$

Φ is a constant around the boundary.

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

7

TORSION OF NON-CIRCULAR BARS:

For a solid section, $\Phi = 0$ ——— (I)

around the boundary

On the end faces moment about O should be equal to the applied torque.

$$\begin{aligned} T &= \iint_R (\tau_{yz}x - \tau_{xz}y) \, dx \, dy \\ &= - \iint_R \left(x \frac{\partial \Phi}{\partial x} + y \frac{\partial \Phi}{\partial y} \right) \, dx \, dy \\ &= - \iint_R \left[\left(\frac{\partial(\Phi x)}{\partial x} + \frac{\partial(\Phi y)}{\partial y} \right) - 2\Phi \right] \, dx \, dy \\ &= - \iint_R \left[\left(\frac{\partial(\Phi x)}{\partial x} + \frac{\partial(\Phi y)}{\partial y} \right) \right] \, dx \, dy + \iint_R 2\Phi \, dx \, dy \end{aligned}$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

8

TORSION OF NON-CIRCULAR BARS:

Using Gauss theorem,

$$T = \oint_S [\Phi \cdot x \cdot n_x + \Phi \cdot y \cdot n_y] dx dy + \iint_R 2\Phi dx dy$$

Since Φ is zero around the boundary the first integral becomes zero and the above equation becomes

$$T = \iint_R 2\Phi dx dy \quad \text{--- (II)}$$

To find out the constant F in equ 3, taking LHS of equ 3 we get

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = G \left[\frac{\partial \gamma_{zx}}{\partial y} - \frac{\partial \gamma_{yz}}{\partial x} \right]$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

9

TORSION OF NON-CIRCULAR BARS:

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = G \left(\frac{\partial}{\partial y} \left[\frac{\partial u}{\partial z} + \frac{\partial w}{\partial x} \right] - \frac{\partial}{\partial x} \left[\frac{\partial v}{\partial z} + \frac{\partial w}{\partial y} \right] \right)$$

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = G \left(\frac{\partial}{\partial z} \left[\frac{\partial u}{\partial y} - \frac{\partial v}{\partial x} \right] \right)$$

$$= G \frac{\partial}{\partial z} [-2\omega_z]$$

Where ω_z is the rotation of the element at (x,y) about the z axis.

$\frac{\partial}{\partial z} [\omega_z]$ is the rotation per unit length denoted by θ

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = -2G\theta \quad \text{--- (III)}$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

10

TORSION OF NON-CIRCULAR BARS:

Summary of Prandtl's Method:

Φ is a constant around the boundary.

For a solid section, around the boundary

$$\Phi = 0 \quad \text{--- (I)}$$

$$T = \iint_R 2\Phi dx dy \quad \text{--- (II)}$$

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = -2G\theta \quad \text{--- (III)}$$

$$\tau_{zx} = \frac{\partial \Phi}{\partial y} \quad \tau_{zy} = -\frac{\partial \Phi}{\partial x}$$

21st March 2017

by Dr. Manoj G Tharian

11

TORSION OF NON-CIRCULAR BARS:

Prandtl's Membrane Analogy

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

12

TORSION OF NON-CIRCULAR BARS:

Prandtl's membrane analogy is very much useful for solving torsion problems involving complicated shapes. Consider a thin homogeneous membrane (like rubber) stressed with uniform tension and fixed at its edges which is having the same shape as the cross section of the shaft in the xy plane.

When the membrane is subjected to uniform lateral pressure P it undergoes a small displacement Z, where Z is a function x & y

Consider the equilibrium of an infinitesimal element ABCD of the membrane after deformation. Let F be the uniform tension per unit length of the membrane.

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

13

TORSION OF NON-CIRCULAR BARS:

The value of the initial tension is large enough to ignore its changes when the membrane is blown up by a small pressure.

Force on face AD = $F \times \Delta y$

Angle made by this force with x axis is β

Slope of AB = $\tan \beta = \frac{\partial z}{\partial x}$

Hence the component of $F\Delta y$ along z axis = $F\Delta y \frac{\partial z}{\partial x}$

(for very small angle $\sin \beta = \tan \beta$)

Force on BC = $F \times \Delta y$

Angle made by this face with x axis is $\beta + \Delta \beta$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

14

TORSION OF NON-CIRCULAR BARS:

$$\text{Slope at B} = \frac{\partial z}{\partial x} + \frac{\partial}{\partial x} \left(\frac{\partial z}{\partial x} \right) \Delta x$$

The component of the force in the z direction is $F \Delta y \left[\frac{\partial z}{\partial x} + \frac{\partial}{\partial x} \left(\frac{\partial z}{\partial x} \right) \Delta x \right]$

Similarly the component of force $F \Delta x$ acting on faces AB and CD are

$$F \Delta x \frac{\partial z}{\partial y} \text{ and } F \Delta x \left[\frac{\partial z}{\partial y} + \frac{\partial}{\partial y} \left(\frac{\partial z}{\partial y} \right) \Delta y \right]$$

The resultant force in the z direction is

$$\begin{aligned} -F \Delta y \frac{\partial z}{\partial x} + F \Delta y \left[\frac{\partial z}{\partial x} + \frac{\partial}{\partial x} \left(\frac{\partial z}{\partial x} \right) \Delta x \right] - F \Delta x \frac{\partial z}{\partial y} + F \Delta x \left[\frac{\partial z}{\partial y} + \frac{\partial}{\partial y} \left(\frac{\partial z}{\partial y} \right) \Delta y \right] \\ = F \frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} \Delta x \Delta y \end{aligned}$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

15

TORSION OF NON-CIRCULAR BARS:

The force due to the pressure P acting on the membrane element

ABCD is $P \Delta x \Delta y$.

For equilibrium

$$F \left[\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} \right] \Delta x \Delta y = -P \Delta x \Delta y$$

$$\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = -\frac{P}{F}$$

Comparing the above equ. With the Prandtl's Torsion equ.

$$\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = -2G\theta$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

16

TORSION OF NON-CIRCULAR BARS:

If we adjust the membrane tension F or the air pressure P such that P/F becomes numerically equal to $2G\theta$ the above two equations becomes identical.

If the membrane height z remains zero at the boundary contour of the section, then the height z of the membrane becomes numerically equal to the torsion stress function.

The slopes of the membrane are then equal to the shear stresses.

The twist moment is numerically equal to twice the volume under the membrane.

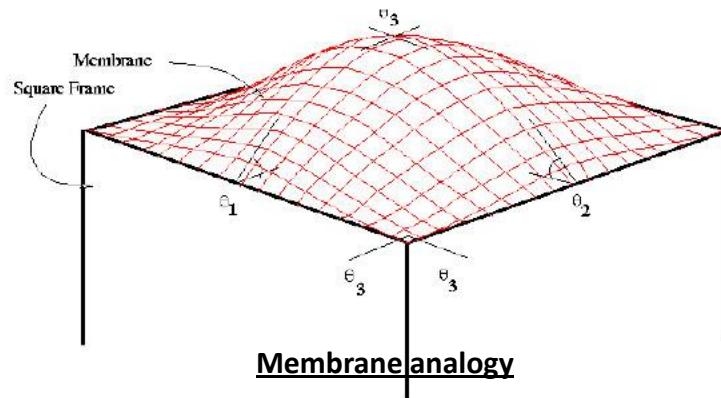

$$\tau_{zx} = \frac{\partial \Phi}{\partial y} \quad \tau_{zy} = -\frac{\partial \Phi}{\partial x} \quad T = \iint_R 2\Phi dx dy$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

17

TORSION OF NON-CIRCULAR BARS:

A steel plate with a square hole was used. Rubber sheet was rigidly clamped at the edges of the hole and made to bulge by applying pressure from beneath the plate. The resulting bulges (torsional hills) for the square hole is shown in Figures.

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

18

TORSION OF NON-CIRCULAR BARS:

Solving Torsion of Elliptical Shaft Using Prandtl's Method:

The torsion equation $\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = -2G\theta$ and boundary condition $\Phi = 0$ are

satisfied by assuming:
$$\phi = m \left[\frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 \right]$$

Where m is constant whose value has to be determined.

$$\nabla^2 \phi = \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = -2G\theta$$

$$\frac{\partial \phi}{\partial x} = m \left(\frac{2x}{a^2} \right) \quad \frac{\partial^2 \phi}{\partial x^2} = \frac{2m}{a^2}$$

$$\frac{\partial \phi}{\partial y} = m \left(\frac{2y}{b^2} \right) \quad \frac{\partial^2 \phi}{\partial y^2} = \frac{2m}{b^2}$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

19

TORSION OF NON-CIRCULAR BARS:

Substituting in the torsion equation we get

$$2m \left(\frac{1}{a^2} + \frac{1}{b^2} \right) = -2G\theta \quad m = - \left(\frac{a^2 b^2}{a^2 + b^2} \right) G\theta$$

Substituting for m in the expression for ϕ :

$$\phi = - \left(\frac{a^2 b^2}{a^2 + b^2} \right) \left[\frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 \right] G\theta$$

The shear stress components are:

$$\tau_{zx} = \frac{\partial \phi}{\partial y} = - \left(\frac{a^2 b^2}{a^2 + b^2} \right) \frac{2y}{b^2} G\theta = - \left(\frac{2a^2}{a^2 + b^2} \right) G\theta y$$

$$\tau_{zy} = - \frac{\partial \phi}{\partial x} = \left(\frac{a^2 b^2}{a^2 + b^2} \right) \frac{2x}{b^2} G\theta = \left(\frac{2b^2}{a^2 + b^2} \right) G\theta x$$

21st March 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

20

TORSION OF NON-CIRCULAR BARS:

Resultant stress is given by:

$$\tau = \sqrt{\tau_{yz}^2 + \tau_{xz}^2} = \frac{\pm 2G\theta}{\sqrt{a^2 + b^2}} \sqrt{a^4 y^2 + b^4 x^2}$$

Equating the moment due to shear stress to the external torque:

$$T = \iint_A (\tau_{zy}x - \tau_{zx}y) dA$$

$$\begin{aligned} T &= \iint_A \left(\left(\frac{2b^2}{a^2 + b^2} \right) G\theta x^2 + \left(\frac{2a^2}{a^2 + b^2} \right) G\theta y^2 \right) dA \\ &= \frac{2G\theta}{a^2 + b^2} \iint_A (a^2 y^2 + b^2 x^2) dA \end{aligned}$$

TORSION OF THIN WALLED TUBES:

$$T = 2 A_1 q_1 + 2 A_2 q_2 \quad \text{———— (1)}$$

$$2G\theta = \frac{1}{A_1} [a_1 q_1 - a_{12} q_2] \quad \text{———— (2)}$$

$$2G\theta = \frac{1}{A_2} [a_2 q_2 - a_{12} q_1] \quad \text{———— (3)}$$

41

TORSION OF THIN WALLED TUBES:

$$A_1 = A_2 = 14.375 \times 28.75 = 0.04133 \text{ m}^2$$

$$4900 = 4 \times 0.04133 \times q$$

$$q = 29641 \text{ N/m}$$

$$\tau_{\max} = 2.371 \text{ MPa}$$

$$\theta = 2.063 \times 10^{-4} \text{ radians per m length}$$

$$T = 2 A_1 q_1 + 2 A_2 q_2 \quad \text{———— (1)}$$

$$2G\theta = \frac{1}{A_1} [a_1 q_1 - a_{12} q_2] \quad \text{———— (2)}$$

$$2G\theta = \frac{1}{A_2} [a_2 q_2 - a_{12} q_1] \quad \text{———— (3)}$$

TORSION OF THIN WALLED TUBES:

Open Section:

$$\tau_{\max} = 107.512 \text{ MPa}$$

$$\theta = 0.1075 \text{ radians per m length}$$

Closed Section:

$$\tau_{\max} = 2.371 \text{ MPa}$$

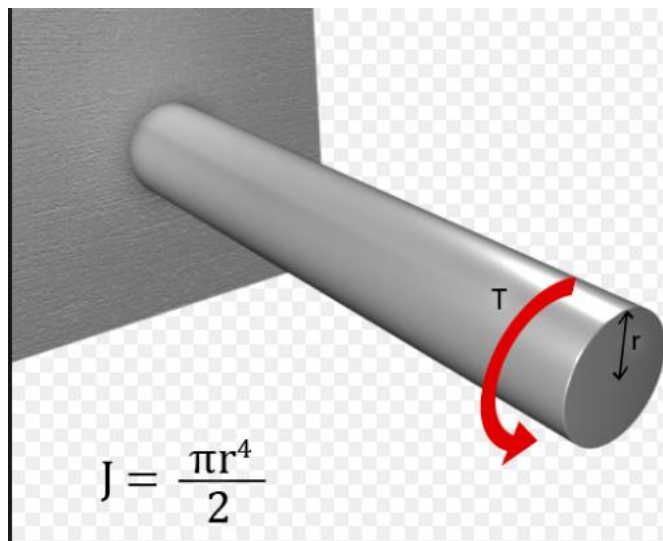

$$\theta = 2.063 \times 10^{-4} \text{ radians per m length}$$

SUMMARY: TORSION OF CIRCULAR SHAFTS

27th April 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

44

SUMMARY: CIRCULAR SHAFT

$$\frac{T}{J} = \frac{\tau}{r} = \frac{G\theta}{l}$$

$$J = \frac{\pi d^4}{32}$$

T – Applied Torque in N-m.

J – Polar Moment of Inertia m⁴.

τ – Shear Stress at a radius r in N/m².

G – Modulus of Rigidity. in N/m².

θ – Angular Twist in Radians.

l – length considered in m.

$$J = \frac{\pi(d_1^4 - d_2^4)}{32}$$

$$J = \frac{\pi d^3 t}{4}$$

SUMMARY: TORSION OF NON CIRCULAR SHAFT ST VENANT METHOD

$$\frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} = 0$$

$$\left(\frac{\partial \psi}{\partial x} - y\right) \frac{dy}{ds} - \left(\frac{\partial \psi}{\partial y} + x\right) \frac{dx}{ds} = 0$$

$$J = \iint_R \left(x^2 + y^2 + x \cdot \frac{\partial \psi}{\partial y} - y \cdot \frac{\partial \psi}{\partial x}\right) dx \cdot dy$$

$$T = G \cdot J \cdot \theta$$

$$\tau_{yz} = G \gamma_{yz} = G\theta \left(\frac{\partial \psi}{\partial y} + x\right) \quad \tau_{xz} = G \gamma_{xz} = G\theta \left(\frac{\partial \psi}{\partial x} - y\right)$$

$$u = -\theta \cdot y \cdot z \quad v = \theta \cdot x \cdot z \quad w = \theta \cdot \psi(x, y)$$

For Elliptical Section:

$$\tau_{\max} = \frac{2T}{\pi a b^2}$$

$$\theta = \frac{T a^2 + b^2}{G \pi a^3 b^3}$$

SUMMARY: TORSION OF NON CIRCULAR SHAFTS PRANDTL'S METHOD

Summary of Prandtl's Method:

Φ is a constant around the boundary.

For a solid section, around the boundary

$$\Phi = 0$$

$$T = \iint_R 2\Phi dx dy$$

$$\frac{\partial^2 \Phi}{\partial x^2} + \frac{\partial^2 \Phi}{\partial y^2} = 2G\theta$$

$$\tau_{zx} = \frac{\partial \Phi}{\partial y} \quad \tau_{zy} = -\frac{\partial \Phi}{\partial x}$$

Prandtl's Membrane Analogy:

If the membrane height z remains zero at the boundary

The twist moment is numerically equal to twice the volume under the membrane.

$$\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = -\frac{P}{F}$$

The slopes of the membrane are then equal to the shear stresses.

SUMMARY: THIN WALLED CLOSED SECTION SUBJECTED TO TORSION

27th April 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

48

SUMMARY: THIN WALLED CLOSED SECTION SUBJECTED TO TORSION

$$T = 2qA$$

$$2G\theta = \frac{q}{A} \oint \frac{ds}{t}$$

$$T = G \frac{4A^2}{\oint \frac{ds}{t}} \theta$$

27th April 2017

$$T = 2 A_1 q_1 + 2 A_2 q_2$$

$$2G\theta = \frac{1}{A_1} [a_1 q_1 - a_{12} q_2]$$

$$2G\theta = \frac{1}{A_2} [a_2 q_2 - a_{12} q_1]$$

FAQS

1. Discuss the importance of Shear Flow?
2. How will you find torsion effect in a solid bar of non-circular cross-section? Give a standard methodology.
3. Explain Prandtl's method.
4. Explain St. Venant's method.
5. Explain Prandtl's Membrane analogy for torsion of non circular bars.
6. An elliptical shaft of semi axes $a = 0.05\text{m}$ and $b = 0.025\text{ m}$ and $G = 800\text{ Gpa}$ is subjected to twisting moment of $1200 \pi\text{ N.m}$. Determine the maximum shear stress and the angle of twist per unit length
7. Solve the torsion problem of elliptical shaft using Prandtl's method.
8. Establish the shape of the prismatic bar for which $\Psi = A(y^3 - 3x^2y)$ is a possible warping function.

27th April 2017

Presented to S4 ME students of RSET
by Dr. Manoj G Tharian

52

FAQS

9. With neat sketches and assumption, derive the torsion formula for any two thin walled open sections.
10. Explain the techniques for finding torsion of thin walled closed section.
11. Derive the expression for torsion of thin walled open and closed sections.
12. Problems discussed in the class
